

Annual Drinking Water Quality Report

2023 (2022 Data)

Manchester Township Water Utility - Eastern
Service Area

PWSID# NJ1518005

**MANCHESTER
TOWNSHIP**
OCEAN COUNTY, NEW JERSEY

Manchester Township Water Utility's goal is to provide you with water that meets or surpasses all the standards for safe drinking water. The Eastern Service Area (NJ1518005) delivers water to portions of the northeastern section of the township, along the route 37, 70 and 571 corridors.

These health and safety standards are set by the United States Environmental Protection Agency (EPA) and the New Jersey Department of Environmental Protection (NJDEP). We're at work 24 hours a day, 365 days a year to provide you and your family with top quality water. We regularly test water samples to be sure that your water meets the safety standards. All the test results are on file with the NJDEP, the agency that monitors and regulates drinking water quality in our state. Both the EPA and the NJDEP require water suppliers to send a Consumer Confidence Report (CCR) to customers on an annual basis.

This CCR provides important information about your drinking water. It shows how your drinking water measured up to government standards during 2022. Please read it carefully and feel free to call the Manchester Township Water Utility at 732-657-8121 or the EPA Safe Drinking Water Hotline at 800-426-4791 with any questions. If you have specific questions about water as it relates to your personal health, we suggest that you contact your health care provider.

Where does your water come from?

Manchester Township Water Utility - Eastern, herein after "Eastern" obtains our water from six active wells drilled between 75 and 1150 feet into two underground sources of water called the Cohansey and the Upper Raritan Aquifers. The Township controls the property around these wells and restricts any activity that could contaminate them. All our water is treated at one of three treatment facilities located at or near the wells.

The treatment facilities include treatment for iron removal, corrosion control, radium removal and disinfection.

To comply with state and federal regulations, Manchester Township Water Utility-Eastern issues an annual Consumer Confidence Report describing the quality of the drinking water supplied to our customers.

If you have any questions about the drinking water that Eastern supplies, please call 732-657-8121. The water quality report for Eastern can be found at

<http://www.manchestertwp.com/departments/public-works-and-utilities/>

Waived Requirements

The Safe Drinking Water Act regulations allow monitoring waivers to reduce or eliminate the monitoring requirements for asbestos, volatile organic chemicals, and synthetic organic chemicals. Our system has been granted a waiver for synthetic organic chemicals.

Contact Information

Please contact Manchester Township Water Utility at 732-657-8121 regarding the content of this report. We encourage public participation at our regular meeting which is held every second and fourth Monday of each month at 6:00pm. Meetings are located at the Municipal Building, 1 Colonial Drive, Manchester, NJ.

Call us at 732-657-8121 to find out how to get your water tested for lead. Testing is essential because you cannot see, taste, or smell lead in drinking water.

Lead Notice

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Manchester Water Utility is responsible for providing high quality drinking water but cannot control the variety of materials used in interior plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

Landlords must distribute this information to every tenant as soon as practicable, but no later than three business days after receipt. Delivery must be done by hand, mail, or email, and by posting the information in a prominent location at the entrance of each rental premises, pursuant to section 3 of P.L. 2021, c. 82 (C.58:12A-12.4 et seq.)

How do drinking water sources become polluted?

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the number of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the **EPA's Safe Drinking Water Hotline (800-426-4791)**.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.

Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.

Organic chemical contaminants, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.

Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

Source Water Assessments

The NJDEP has completed and issued the Source Water Assessment Report and Summary for this public water system, which is available at <http://www.state.nj.us/dep/swap> or by contacting NJDEP, Bureau of Safe Drinking Water at 609- 292-5550 or watersupply@dep.nj.gov.

The source water assessment table for Eastern is provided below. The table provides the number of wells that have either a high (H), medium (M), or low (L) susceptibility rating for each of eight contaminant categories.

If a water system is rated highly susceptible for a contaminant category, it does not mean a customer is or will be consuming contaminated drinking water. The rating reflects the potential for contamination of source water, not the existence of contamination. Public water systems are required to monitor for regulated contaminants and to install treatment if any contaminants are detected at frequencies and concentrations above allowable levels. As a result of the assessments, the DEP may change existing monitoring schedules based upon susceptibility ratings.

Pathogens: Disease-causing organisms such as bacteria and viruses. Common sources are animal and human fecal wastes.

Nutrients: Compounds, minerals and elements (both naturally occurring and man-made) that aid plant growth. Examples include nitrogen and phosphorus.

Pesticides: Man-made chemicals used to control pests, weeds and fungus. Common sources include land application and manufacturing of pesticides. Examples include herbicides such as atrazine, and insecticides such as chlorodane.

Radionuclides: Radioactive substances that are both naturally occurring and man-made. Examples include radium and uranium.

Inorganics: Mineral-based compounds that are both naturally occurring and man-made. Examples include arsenic, asbestos, copper, lead, and nitrate.

Radon: Colorless, odorless, cancer-causing gas that occurs naturally in the environment. For more information go to <http://www.nj.gov/dep/rpp/radon/index.htm> or call 800-648-0394.

Disinfection Byproduct Precursors: A common source is naturally occurring organic matter in surface water. Disinfection byproducts are formed when the disinfectants used to kill pathogens (usually chlorine) react with dissolved organic material (leaves, etc.) in surface water.

Volatile Organic Compounds: Man-made chemicals used as solvents, degreasers, and gasoline components. Examples include benzene, methyl tertiary butyl ether (MTBE), and vinyl chloride.

	Pathogens			Nutrients			Pesticides			Volatile-Organic Compounds			Inorganics			Radio nuclides			Radon			Disinfection Byproduct Precursors		
Sources	H	M	L	H	M	L	H	M	L	H	M	L	H	M	L	H	M	L	H	M	L	H	M	L
6 Wells	0	0	6	0	3	3	0	0	6	0	0	6	3	3	0	1	5	0	1	3	2	0	6	0

People with Special Health Concerns

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV / AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA / CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

2022 Water Quality Results

2022, 2021 & 2020 Data

Radioactive Contaminants	MCLG	MCL	Level Detected	Violation	Likely Source
Combined Radium - 228 & 226 Test Results Year 2022	0 pCi/L	5 pCi/L	Range: 1.5-4.3 Highest: 4.3	N	Erosion of natural deposits
Gross Alpha Test Results Year 2022	0 pCi/L	15 pCi/L	Range: ND-10.2 Highest: 10.2	N	Erosion of natural deposits
Inorganic Chemicals	MCLG	MCL	Level Detected	Violation	Likely Source
Barium Test Results Year 2020	2000 ppb	2000 ppb	Range: 61.6 – 102.0 Highest: 102.0	N	Discharge of drilling wastes, metal refineries, and erosion of natural deposits
Nitrate (as Nitrogen) Test Results Year 2022	10 ppm	10 ppm	Range: ND-2.5 Highest: 2.5	N	Runoff from fertilizer use; Leaching from septic tanks, sew age; Erosion of natural deposits
Fluoride Test Results Year 2020	4 ppm	4 ppm	Range: ND-0.06 Highest: 0.06	N	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Nickel Test Results Year 2020	n/a	n/a	Range: 0.61-2.52 ppb Highest: 2.52 ppb	N	Leaching from ore-processing sites, and discharge from electronics, glass, and drug factories
Lead & Cooper	MCLG	AL	Level Detected	Violation	Likely Source
Copper Test Results Year 2021	1.3 ppm	1.3 ppm	90th Percentile: 0.132 Samples > AL: 0	N	Corrosion of household plumbing systems and erosion of natural deposits
Lead Test Results Year 2021	0 ppb	15 ppb	90th Percentile: 1.13 Samples > AL: 0	N	Corrosion of household plumbing systems and erosion of natural deposits
Regulated Disinfectants	MRDLG	MRDL	Level Detected	Violation	Likely Source
Chlorine Test Results Year 2022	4.0 ppm	4.0 ppm	Range: 0.5-1.87 Average: 0.68	N	Treatment process
Volatile Organic Compounds / Disinfection By-Products	MCLG	MCL	Level Detected	Violation	Likely Source
HAA5 Haloacetic Acids Test Results Year 2022	n/a	60 ppb	Range: ND – 3.90 Highest: 4.02 LRAA	N	Byproduct of drinking water disinfection
THM Total Trihalomethanes Test Results Year 2022	n/a	80 ppb	Range: 3.42 – 14.21 Highest: 13.81 LRAA	N	Byproduct of drinking water disinfection
Synthetic Organic Compounds (SOC)	MCLG	MCL	Level Detected	Violation	Likely Source
Perfluorooctane Sulfonic Acid (PFOS) Test Results Year 2022	n/a	13 ppt	Range: ND - 13.0 Highest: 9.5 RAA	N	Discharge from industrial chemical factories
Perfluorooctanoic Acid (PFOA) Test Results Year 2022	n/a	14 ppt	Range: ND - 11.0 Highest: 8.2 RAA	N	Discharge from industrial chemical factories

Secondary Contaminants	RUL	Level Found	Violation	Likely Source
Iron Test Results Year 2022-2020	0.3 ppm	Range: ND - 0.112 Highest: 0.112	N	Erosion of natural deposits
Manganese + Test Results Year 2022-2020	50 ppb ++	Range: 9.4 - 72.8 Highest: 72.8	N	Erosion of natural deposits
Chloride Test Results Year 2022-2020	250 ppm	Range: ND - 36.0 Highest: 36.0	N	Erosion of natural deposits
Sodium Test Results Year 2022-2020	50 ppm	Range: 4.29 - 23.5 Highest: 23.5	N	Naturally present in the environment
pH Test Results Year 2022	6.5-8.5 Units	Range: 7.01 - 7.86 Highest: 7.86	N	Naturally present in the environment
Sulfate Test Results Year 2020	250 ppm	Range: 6.1 - 7.87 Highest: 8.72	N	Erosion from natural deposits; Industrial wastes
Hardness, Carbonate Test Results Year 2020	250 ppm	Range: 63.0 - 85.0 Highest: 85.0	N	Naturally present in the environment
Total Dissolved Solids (TDS) Test Results Year 2020	500 ppm	Range: 80.0 - 208.0 Highest: 208.0	N	Erosion from natural deposits

Secondary Contaminants	RUL	Level Found	Violation	Likely Source
Aluminum Test Year 2020	0.2 ppm	Range: 0.037 - 0.100 Highest: 0.100	N	Erosion of natural deposits
* The recommended upper limit for manganese is based on staining of laundry. Manganese is an essential nutrient, and toxicity is not expected from high levels which would not be encountered in drinking water.				
** When a sequestering treatment is provided, the RUL is increased to 100 ppb. We add a sequestering agent at two of our facilities where the concentration of manganese exceeds 50 ppb.				
Microbiologicals-Revised Total Coliform Rule (RTCR)	Number Required	Number Completed	Corrective Actions Required	Corrective Actions Completed
Level 1 Assessment - Total Coliform	0	0	0	0
Total coliform bacteria are generally not harmful themselves. Coliforms are bacteria which are naturally present in the environment and are used as an indicator that other potentially harmful bacteria may be present. 1 of 363 samples analyzed was positive for total coliform bacteria. Level 1 Assessment was not required.				

Important Information About Your Drinking Water

We are required to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether or not your drinking water meets health standards. During the 01/01/2022–03/31/2022 monitoring period we did not complete all testing for PFAS and Radiologicals at Treatment Facility 7, and therefore cannot be sure of the quality of your drinking water during that time. Treatment Facility 7 was offline for the entirety of this monitoring period, therefore no water from this location was delivered to our customers. These contaminant groups are sampled quarterly, and have been sampled every quarter the facility has been actively delivering water to our customers. The results of those samples are listed in the "2022 Water Quality Results" table. We are correcting the problem in the future by submitting an out-of-service form to the NJDEP as necessary to eliminate future violations.

There is nothing you need to do at this time. For more information, please contact us. Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.

Perfluorooctanoic Acid (PFOA)

Some people who drink water containing PFOA in excess of the MCL over many years could experience problems with their blood serum cholesterol levels, liver, kidney, immune system, or, in males, reproductive system. Drinking water containing PFOA in excess of the MCL over many years may also increase the risk of testicular and kidney cancer. For females, drinking water containing PFOA in excess of the MCL over many years may cause development delays in a fetus and/or an infant.

Perfluorooctanesulfonic Acid (PFOS)

Some people who drink water containing PFOS in excess of the MCL over many years could experience problems with their immune systems, kidneys, liver or endocrine system. For females, drinking water containing PFOS in excess of the MCL over many years may cause development effects and problems with the immune system, liver, or endocrine system in a fetus and/or an infant. Some of these development effects can persist through childhood.

Definitions

ppm	Parts Per Million: equivalent of one second in 12 days
ppb	Parts Per Billion: equivalent of one second in 32 years
ppt	Parts Per Trillion: equivalent of one second in 32,000 years
NA	Not Applicable
RAA	Running Annual Average
RUL	Recommended Upper Limit

Primary Standards: Federal drinking water regulations for substance that are health – related. Water suppliers must meet all primary drinking water standards.

Secondary Standards: Federal drinking water measurements for substances that do not have an impact on health. These reflect aesthetic qualities such as taste, odor and appearance. Secondary standards are recommendations, not mandates.

AL **Action Level:** The concentration of a contaminant which, if exceeded triggers treatment or other requirement which a water system must follow.

TT	Treatment Technique: A required process intended to reduce the level of a contaminant in drinking water.
MCL	Maximum Contaminant Level: The highest level of a containment that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
MCLG	Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
MRDL	Maximum Residual Disinfectant Level: The highest level of disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
MRDLG	Maximum Residual Disinfectant Level Goal: The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectant to control microbial contamination.
